

米国・エネルギー省エネルギー効率・再生可能エネルギー局 (DOE-EERE)
風力エネルギープログラム (Wind Energy Program) の例

Table 2. Program Logic Model for Wind Program

| Project | Large Wind Turbine Technology | Distributed Wind Technology | Transmission & System Integration | Technology Acceptance |
|--|--|--|---|--|
| Resources | <ul style="list-style-type: none"> • Appropriations • Industry cost sharing • NWT facilities • IEA | <ul style="list-style-type: none"> • Appropriations • Industry cost sharing • NWT facilities | <ul style="list-style-type: none"> • Appropriations • State funds • Partners | <ul style="list-style-type: none"> • Appropriations • State funds (energy offices) • Partners |
| Activities | <ul style="list-style-type: none"> • Technology development through public-private partnerships. • Supporting research and testing. • Reliability and performance improvement for existing turbine technologies. • Low wind speed technology development. • Offshore wind and resource assessment. | <ul style="list-style-type: none"> • Technology development through public-private partnerships. • Supporting research and testing. | <ul style="list-style-type: none"> • Wind generator modeling. • Wind farm data monitoring. • Resource characterization. • Grid operational impact analysis. • Transmission and generation planning. • Grid rules development. • Institution building through utility partnerships. | <ul style="list-style-type: none"> • Outreach to state-based organizations. • Small wind. • Institution building through utility partnerships. • Support for Native American interest in wind power. • Environmental and siting mitigation. • Emerging applications. • Resource Assessment. |
| Outputs | <ul style="list-style-type: none"> • New components, concepts and wind systems for land-based applications in Class 4 wind regimes. • Basic research tools to assist industry. • COE 3.6 cents/kWh in Class 4 wind by 2012. • Better understanding of offshore wind energy market and technical challenges. • COE 5 cents/kWh in Class 6 wind in shallow water by 2014. | <ul style="list-style-type: none"> • By 2015 expand by five-fold the number of distributed wind turbines deployed in the U.S. market from a 2007 baseline. • New components, concepts and wind systems for applications of less than 100 kW. • Development of wind turbines to support mid-sized market applications. | <ul style="list-style-type: none"> • Ability of wind systems to compete without disadvantage in key areas of market rules, interconnection impacts, operating strategies, and system planning. • Development of new transmission to facilitate wind development. | <ul style="list-style-type: none"> • 30 states with mature markets that support wind industry growth. • Technical and outreach support widely available. • Fewer barriers to large and small wind integration. |
| Short-term Outcomes 2007–2010 | <ul style="list-style-type: none"> • The use of wind energy in high and low resource areas accelerates due to their improved cost effectiveness. | <ul style="list-style-type: none"> • Wind turbines for residential (1–2 kW) use and commercial/community applications (100 kW and above) enter the marketplace. | <ul style="list-style-type: none"> • Wind becomes a participant in defining the national needs of emerging grid operation and rulemaking processes. • Announcement of 3 new transmission lines to bring low-cost wind to urban load centers. | <ul style="list-style-type: none"> • 30 states achieve a level of public awareness and policy environment that fosters a vibrant market for wind energy development. |
| Intermediate Outcomes 2010–2020 | <ul style="list-style-type: none"> • The use of wind energy as a low-cost electricity source, without financial incentives, becomes widespread as technology matures. • Commercial development of shallow water technologies. • Commercial wind turbine technology for transitional water depths is developed and demonstrated in offshore sites. | <ul style="list-style-type: none"> • Distributed uses of wind energy at all sizes emerge as a significant opportunity for technology deployment and end-users embrace wind for a growing number of uses. | <ul style="list-style-type: none"> • Utilities and developers gain clear understanding of barriers to integration and know how to address them. • Increased transmission implemented allowing the expanded use of wind technologies. | <ul style="list-style-type: none"> • Public acceptance of wind technologies in rural areas, supporting local economic development. • 6–8 regional wind collaborative organizations emerge and function to plan and integrate appropriately large amounts of wind energy into regional operating systems. |
| Long-Term Outcomes and Problem Solutions 2020 and beyond | <ul style="list-style-type: none"> • The percentage of energy generated from wind exceeds 10%, confirming wind as a major National energy source. • Wind turbine technology for use in deepwater offshore applications is proven economic and becomes a major new electricity source for states bordering coastal zones. | <ul style="list-style-type: none"> • Wind turbines for emerging applications become available and gain acceptance for specialized uses such as hydrogen production and water supply. | <ul style="list-style-type: none"> • Wind achieves high grid penetration level and is a nationally accepted part of our energy portfolio. • National transmission infrastructure allows high levels of wind penetration. | <ul style="list-style-type: none"> • Awareness and acceptance levels are achieved nationally, making further coordination efforts unnecessary. |
